

## IMPORTANT INSTALLATION NOTE FOR WRECKER BODY LED STRIPS

Do not install Boogey Lights LED strips under tension.

When installing Boogey Lights wrecker body led strips it's important to simply unroll the LED strips and push them to the wrecker body surface AS YOU GO versus pulling on the LED strip and pushing the strip to the surface when it is tight. This is a super important concept to understand if you want your lights to last. The natural tendency is to pull tightly on the LED strip to keep it straight and level when mounting horizontally BUT doing so means the solder joints in the LED strip will be installed under maximum tension from day one. Mounting the strips this way doesn't allow any room for the solder joint to move, contract or expand as needed over time. LED strips installed this way will fail prematurely at that solder joint every time. Not a matter of if but when. Strips that fail due to improper installation are not covered under warranty.
